SUMMARY

Backend engineer who owns systems in production rather than in theory. Architected and operate the serverless backend behind Spiko, a cash-positive app with 100,000+ installs, and built the real-time media pipeline behind Brivva in Rust. Strong on failure handling: retries, idempotency, graceful degradation and cost control.

EXPERIENCE

StoneLab Inc. — Senior Software Engineer (Android) Seoul · Jul 2024 – Present

- Architected and operate the serverless backend behind Spiko on Cloudflare Workers, Hono and TypeScript: 140+ routes across 24 feature modules, 100+ tables, 35+ scheduled jobs.
- Integrated three payment gateways (Click, Payme, Paynet) with webhook processors, subscription state machines and recovery jobs.
- Built an asynchronous AI grading pipeline on Cloudflare Queues and Durable Objects with TTL and automatic cleanup.
- Maintained a 99.9% crash-free client surface by designing the API contract and failure modes end to end.
- Mentored a freelancer and an intern on architecture decisions and code review practice.

StoneLab Inc. — Software Engineer Intern Seoul · Jan 2023 – Mar 2023

PROJECTS

Spiko — AI English exam prep (solo) 2025 – Present

- Built and operate a production app with 100,000+ installs and 4.8 stars on Google Play, shipped on Android and iOS.
- Cash-positive after infrastructure, AI inference costs, platform fees and corporate taxes.
- Modular Android architecture: Kotlin, Jetpack Compose, MVVM and feature-based slicing, 480+ Kotlin files.
- Backend on Cloudflare Workers, D1, Queues and Durable Objects, with retries, feature flags and versioned APIs; 140+ routes, 100+ tables, 35+ scheduled jobs.
- Scaled through a 4x growth period without an architectural rewrite, holding the backend error rate under 0.01%.
- Integrated AI speech recognition and feedback pipelines with graceful degradation and retry handling.
- 99.9% crash-free sessions and a 44-minute average session length.

Brivva — Real-time multilingual live commerce (co-founder, tech lead) Mar 2026 – May 2026

- Built the pipeline end to end: one live stream ingested, transcribed, translated, re-voiced in the host's own cloned voice, then fanned out to YouTube, TikTok and Instagram simultaneously.
- 614 commits in two months, including roughly 21,000 lines of Rust (Axum, Tokio, GPU ffmpeg).
- Shared OpenAPI contracts consumed by three runtimes; OpenTofu infrastructure for the GPU workers.
- Documented the failures as well as the wins, including a TTS queue that dropped whole segments to bound latency.
- Archived when the funding round did not close. Published as open source: github.com/TyposBro/brivva

OPEN SOURCE

- [uzpay](#) — zero-dependency TypeScript SDK for three Uzbek payment providers, published on npm with ~80 weekly downloads.
- [Hono](#) — contributed type regression tests that fixed a route type inference bug (PR #4722) in a 30k-star framework.

SKILLS

Languages TypeScript, Rust, Kotlin, SQL

Backend Cloudflare Workers, Hono, D1, R2, Queues, Durable Objects, SQLite, REST, WebSocket, JWT

Media RTMP and GRIP ingest, multi-platform egress, ffmpeg, Soniox speech-to-text, ElevenLabs voice synthesis, OpenAPI contracts

Infra OpenTofu, AWS (ECS, EC2, S3, ASG), Docker, GitHub Actions, observability and alerting

EDUCATION

B.S. Computer Science and Engineering — Ulsan National Institute of Science and Technology (UNIST), 2024
